When I imagine a 'perfect' family, I imagine a mom and dad with maybe two to three young kids and a dog. A sort of looser household, perfect for kids, but not so perfect for parents. This is why I'm slightly disappointed with the new teaser for the Disney Channel's *The Rookie*, which stars Ashley Tisdale and Adam Brody as the parental leads. Although the actors are on-screen together, the teaser doesn't show the whole family together. There is a picture of Tisdale and Brody playing with their baby daughter, and that's it. So...it's not a perfect family, and it seems to be just as tired as I am right now. The new season of 'Teen Beach Movie' is coming next Tuesday at 7 pm, and I can't wait to see it! As soon as I find out more about this season, we'll post the details here. Disney Channel's *The Rookie*'s teaser wasn't exactly 'perfect' either, and that's why this episode of *Monsters in the Morning* looks like it was edited on the fly. Our news anchor, Alex, tells us about the new season of *Teen Beach Movie*. Then, Alex chats with the new Executive Producer. Hoo. Hoo. The more news anchors that ABC puts on the air, the less I can concentrate on reality. This week I enjoyed the attention that ABC's news anchors were giving a Food Network show. I enjoyed it so much that it made me want to just stop watching food programs. ? 'Teen Beach Movie' took me back to my childhood when Disney Channel aired a version of the movie every other month. Luckily they didn't air one for a long time! The new season of this show is coming very soon. Then we'll know exactly what's happening! While shopping for toys this weekend, my daughters found a new version of Ben 10, and asked me to take a picture of them with the new toy. I don't have a clue why they choose to be photographed with a toy, but it could be fun! We'll post some of the pictures here.

The screenshot displays a file sharing interface. On the left, there is a blue folder icon with a white cloud inside. Below it, a rating of 6.4 is shown with five stars and the text '2885 VIEWS'. On the right, the text reads 'File was found and ready to download!' followed by 'UPDATED 14 HOURS AGO'. Below this, it says 'Fastest Source: usenet.nl' with a small orange checkmark. A blue 'Download' button with a white download icon is visible. To the right of the button, it says 'SECURE SCANNED'. Below the main content, there is a message: 'You need to log in before you can post comments.' At the bottom, there are three icons with labels: 'Navigation' (a blue icon with three horizontal bars), 'Registration' (a blue icon with three people silhouettes), and 'FAQ' (a blue circular icon with a question mark).

The effects of naloxone on endogenous opiates in the regulation of food and water intake. Both opiates and appetitive (rewarding) stimuli interact with each other in a number of important ways. It has been suggested that opiates are released in the nucleus accumbens in response to feeding or suckling and that this may be important for the regulation of feeding. The rat was used as a model system to investigate this issue. Specific opiate receptors mediate the suppression of water intake produced by naloxone (1 mg/kg) when administered 15 min before a 30% sucrose solution. However, neither intracerebroventricular (i.c.v.) nor intraperitoneal (i.p.) administration of naloxone results in a comparable suppression. Exposure of rats to a potent diet (50% sucrose) increases the release of beta-endorphin immunoreactivity in the nucleus accumbens. This increase may be a consequence of the diet-induced changes in the regulation of feeding. The i.p. or i.c.v. administration of naloxone, however, does not

significantly alter beta-endorphin immunoreactivity in the nucleus accumbens. Naloxone, administered i.c.v. 15 min prior to sucrose, produced a marked increase in the concentrations of beta-endorphin immunoreactivity in several regions of the hypothalamus, i.e. the nucleus lateralis hypothalami and periventricularis hypothalami. The increase was detected as early as 10 min after the injection and lasted throughout the 90 min observation period. The i.p. or i.c.v. administration of naloxone, 15 min prior to sucrose, also resulted in a marked increase in beta-endorphin concentrations in these two areas of the hypothalamus. In contrast, the administration of naloxone by either route had no effect on the concentration of beta-endorphin in the amygdala, the hippocampus, the cerebral cortex and the medulla-pons. The present experiments demonstrate that opiates, if released at sufficiently high concentrations, might play a role in the regulation of feeding.
